$\qquad$
How much acetic acid is in vinegar???
In this lab, you will determine the \% by weight of acetic acid in vinegar. This is determined by titrating a measured mass of vinegar with NaOH using phenolphthalein as an indicator.

$$
\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \text { (acetic aciid) }+\mathrm{NaOH}----\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

At the endpoint in the titration, the \# of moles of NaOH equals the \# of moles of acetic acid. As you can see from the balanced equation, they react in a $1: 1$ ratio.

## Procedure:

1. Obtain ca. 10~15 mL of vinegar (brand \#1) in a graduated cylinder. Pour into a clean, $50-\mathrm{mL}$ flask \& record the mass of the solution. Add 2 drops phenolphthalein indicator.
2. Set-up a single buret. Prime it \& fill it with 0.550 M NaOH solution.
3. Titrate until the endpoint. Be careful! You won't be able to back-titrate in this lab. Record initial \& final volumes.
4. Repeat with vinegar brand \#2.

## Data Table:

brand \#1: $\qquad$
mass of vinegar:
initial volume NaOH : $\qquad$
final volume NaOH : $\qquad$
volume NaOH used: $\qquad$

## Calculations:

The mass of acetic acid titrated in the vinegar is determined this way:

$$
\text { Liters } \mathrm{OH}^{-} \times \frac{\mathrm{mol} \mathrm{OH}^{-}}{\mathrm{L}} \times \frac{\mathrm{mol} \mathrm{H}^{+}}{\mathrm{mol} \mathrm{OH}^{-}} \times \frac{\mathrm{gHC} \mathrm{HC}_{3} \mathrm{H}_{2}}{\mathrm{~mol}}=
$$

Finally, the \% acetic acid in the vinegar is calculated:

$$
\frac{\mathrm{g} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}}{\mathrm{~g} \text { vinegar }} \times 100 \%
$$

\% acetic acid in brand \#1:
\% acetic acid in brand \#2:
